

During my time at the University of Technology Sydney, I worked on a group project in my Mechatronic Engineering course. The task was to design a robotic system that could sort objects by color using image processing techniques. Our team consisted of students from various cultural backgrounds, including China, India, and Germany. It was challenging to work together at times because everyone had different approaches and ways of communicating.

We had to complete the project on time while working through these differences. I took on a bit of responsibility to help with communication between team members, making sure everyone could contribute. We held some meetings to discuss what we were working on and I suggested using an online platform to keep track of tasks, but it was a bit difficult to keep everyone on the same page since people had different working hours and preferences.

In the end, we finished the project and received a good grade. Although there were challenges with collaboration, I learned a lot about working with people from different cultural backgrounds. It wasn't always easy to get everyone to communicate effectively, but the project showed me how important it is to try to work together despite these differences.
